Postgres 3
Trigger Problems

• create a table called NameChangeLog. The table records changes to the last name of customers. The attributes of the table are logId, oldlast, newlast, changeDate and cid. The data types are serial, varchar(30), varchar(30), date and integer;
• create a trigger that records last name changes to customer rows.
• create a trigger that can check the constraint that the sum of the percent values of a book should always total 100. Fire the trigger whenever the percent value is changed.
create table NameChangeLog(logId serial primary key, oldlast varchar(30), newlast varchar(30) not null, changeDate Date, cid integer not null, foreign key (cid) references Customer(cid));
create or replace function LogLastNameChange() returns trigger AS $$
Declare
Begin
    insert into NameChangeLog (cid, oldlast, newlast, changeDate)
    values (NEW.cid, OLD.last, NEW.last, current_date);

    return NEW;
END;
$$ Language plpgsql;

create trigger LastNameChange before update of last on Customer
    for each row execute procedure LogLastNameChange();
create or replace function CheckPercent() returns trigger AS $$
Declare
   pct integer;
Begin
   select sum(percent) into pct from Writes where booknum = NEW.booknum;
   if pct != 100 then
      raise exception 'The percent value for all authors of book % does not sum to 100',
      NEW.booknum;
      return null;
   end if;
   return NEW;
END;
$$ Language plpgsql;

create trigger CheckPercent after update of percent on Writes
   for each row execute procedure CheckPercent();
create constraint trigger CheckPercent after update of percent on Writes deferrable initially deferred for each row execute procedure CheckPercent();
